ICT Integration Tips for Teachers

Choosing technology that improves teaching and learning

1. Begin with the learning objective

- Decide what learners should learn before selecting a device, app or digital resource.
- Use technology when it improves explanation, practice, collaboration, access or feedback.

2. Prepare before the lesson

- Test equipment, files, speakers and projector connections before learners arrive.
- Keep an offline copy of essential resources in case the internet is unavailable.
- Prepare a non-digital alternative where possible.

3. Use digital resources actively

- Pause videos to ask questions and check understanding.
- Use presentations to clarify key ideas rather than copying long paragraphs onto slides.
- Give learners a clear task when using a computer or tablet.

4. Protect learners and equipment

- Follow school rules for accounts, passwords, online communication and acceptable use.
- Supervise internet activities and avoid sharing learners' personal information.
- Shut down and store equipment according to school procedures.

5. Evaluate impact

- Ask whether the technology helped learners achieve the intended outcome.
- Use learner feedback and assessment evidence to improve future lessons.

These tips are general guidance. Follow your school's ICT policy and applicable child-protection and data-protection requirements.
